*It's NEW!*

WE  
CALL  
IT—

● THUJA OCCIDENTALIS  
COMPACTA ERECTA

THE new *Thuja Occidentalis*  
*Compacta Erecta* as illustrated on  
the opposite page is (7) seven years  
old; it measures 47 inches high.  
This plant grows compact without  
shearing, semi-dwarf in habit of  
growth, excellent for specimen  
landscape material.

Introduced to the trade 1947  
during the American Nurserymen's  
Convention held in Boston, Mass.  
The four plants displayed for the  
first time created much interest  
among growers from all sections of  
the country. We now have plants of  
this variety widely distributed. You  
should have some of these well  
established liners to grow on for  
future specimen landscape material.

## WESTMINSTER NURSERIES

THE NEW EVERGREEN
